

ABSTRACT OF THE DISCLOSURE

A planter for growing a transplanted plant upside down utilizes a container having an interior, a bottom and a hole defined within the bottom and further utilizes a retainer member which is attachable to the plant desired to be transplanted within the planter. Furthermore, the retainer member cooperates with the container for supporting the plant through the hole defined within the container bottom so that the root system is exposed to the interior of the container and so that the plant stem extends downwardly from the bottom of the container.
